

HHO Gas Generator Can Save You 50% of Fuel and Increase Your Engines Performance

What is HHO? HHO is a type of gas that is produced from water via electrolysis. In this process, water (H₂O) is converted to its basic elements hydrogen (H) and oxygen (O). It is sometimes referred to as Brown's gas or Hydroxy.

When you employ HHO conversion plans on your car, you will see a lot of benefits. You will save tons of money on gasoline. A number of people who have used HHO plans have seen their miles per gallon average soar by 60 percent, though 25-30 % is usually the standard. But some of the advantages to using HHO conversion and driving a water hybrid car are not financial. Your engine will last longer, and it will have more power. Also, environmentalists love using HHO conversion, because the emissions that come from the tailpipe of a water gas car are much cleaner than those from a traditional vehicle.

HHO conversion kits do not come cheap. Even ones found on popular online auction sites sell for hundreds of dollars. If you have a few cars you would like to convert this could add up. How HHO gas works is that it is generated in a cell full of water and a catalyst such as baking soda is contained in that cell alone with a few or many plates usually stainless steel that is connected to a car's battery. The designs can vary. The cell is hooked to your cars battery to run the process of electrolysis to generate a gas. The gas is introduced into the intake manifold of your car or truck using the help of your vehicles vacuum. The gas helps your gasoline burn more efficiently, while producing its own combustion. That added combustion of the hydrogen gives you more power, and eventually requires less gasoline to run your engine, resulting, in better gas mileage. Larger engines may require bigger HHO cells but that is not usually an issue a typical cell is about the size of a quart jar.

You may have seen reference to these HHO gas generators online or in forums as hydrogen on demand or even hydrogen cell. This is not exactly pure hydrogen it produces but the effect is similar. The parts to build a homemade HHO gas generators can easily be found in any hardware shop. A really savvy buyer can build a cell for around \$60 and anyone who uses their hands or likes to build stuff should have not problem constructing a homemade hydrogen conversion kit and installing it into a car. When the conversion is made to the car's engine very little modification is needed to the vehicle and they are totally reversible.

HHO gas injection technology is still considered experimental but it is an effective supplemental fuel additive that could help you increase mileage, increase horsepower, reduce emissions while providing a smoother and cleaner engine. So why not make your car to burn water? When you have a set of HHO generator plans in your hands, you will find that it is very easy to build and install a water gas kit. No extensive knowledge of cars is needed. It should take no more than a few hours.
